Time Distribution of loots and combats- AmbroseValley

GrandRift

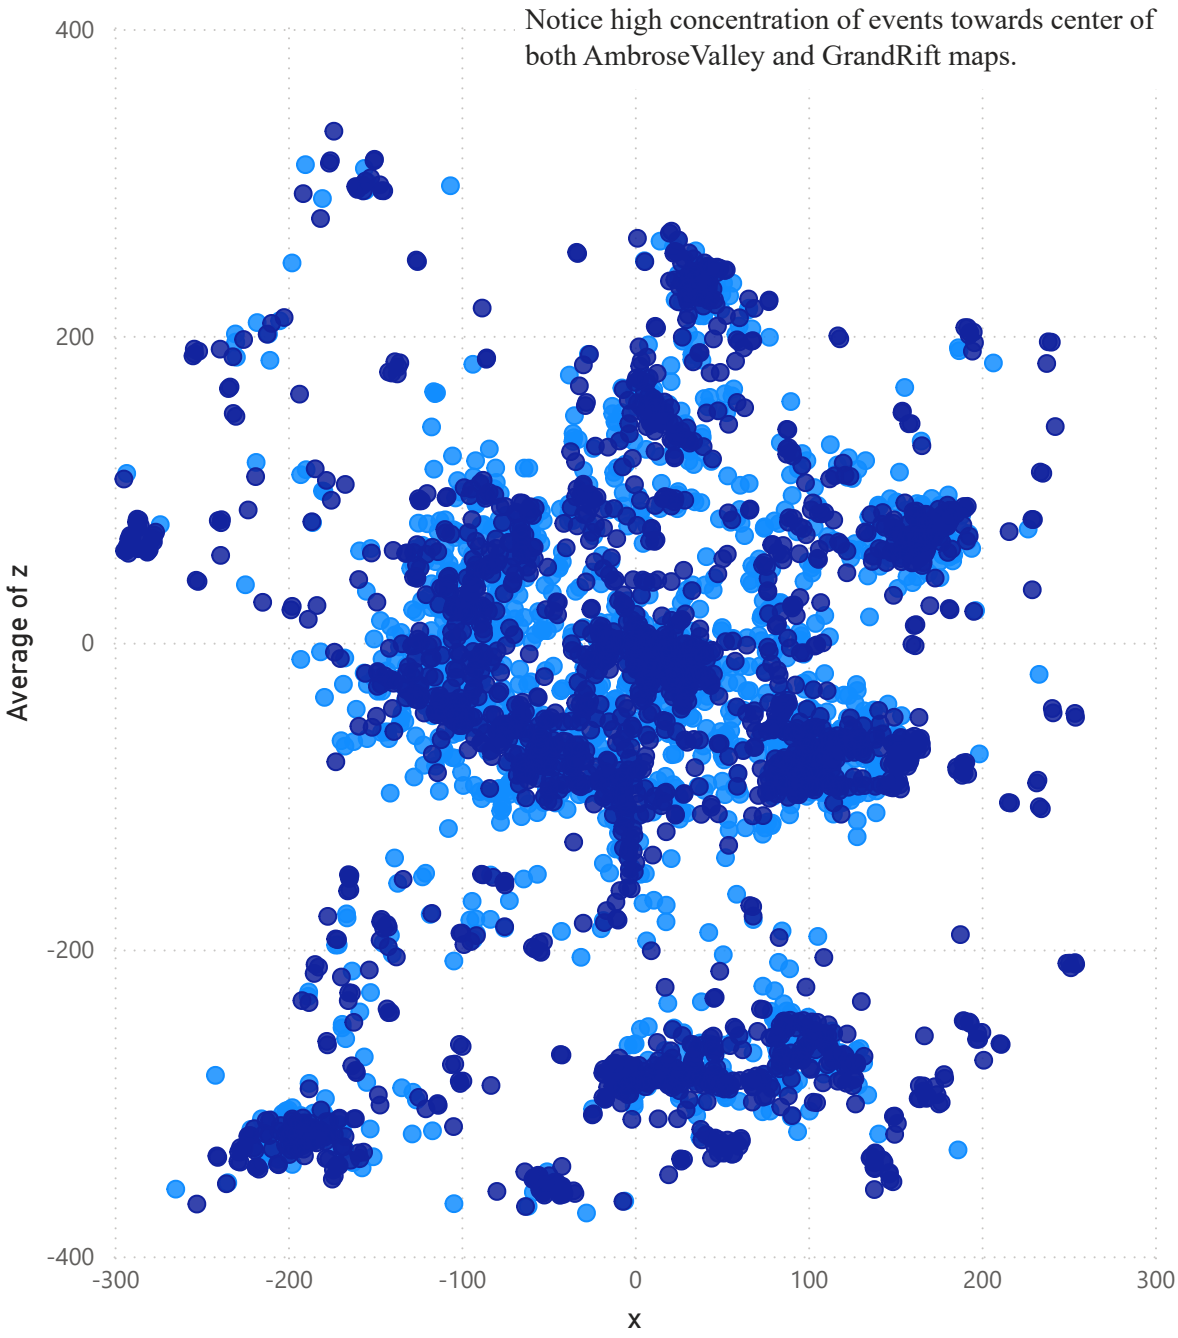

Lockdown

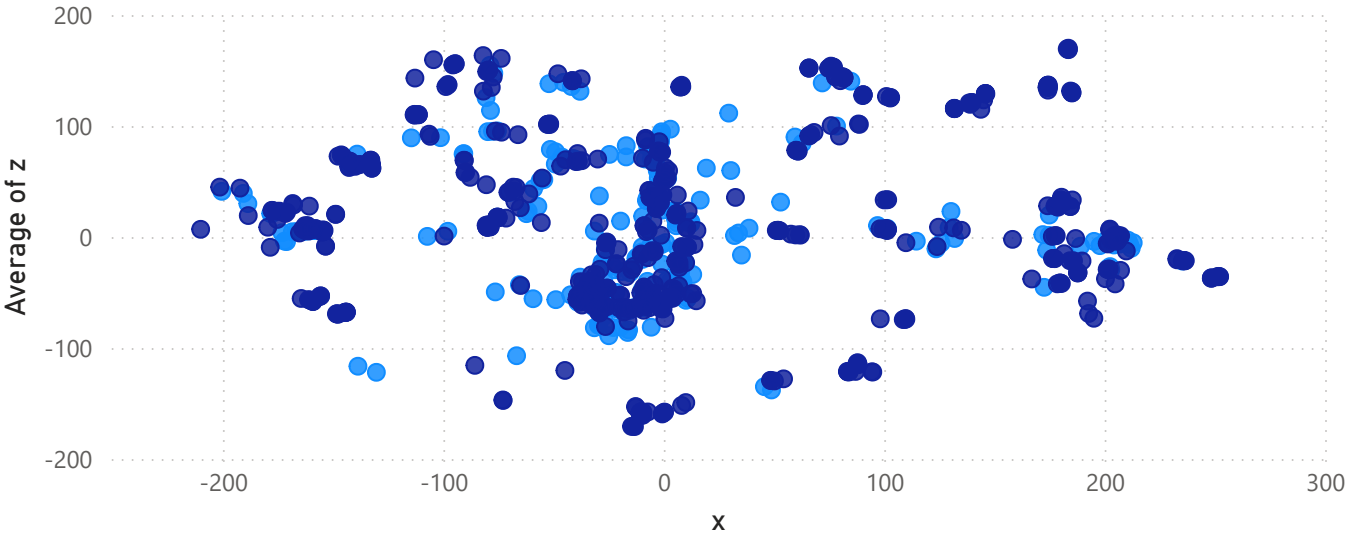

Average positioning of Events - AmbroseValley

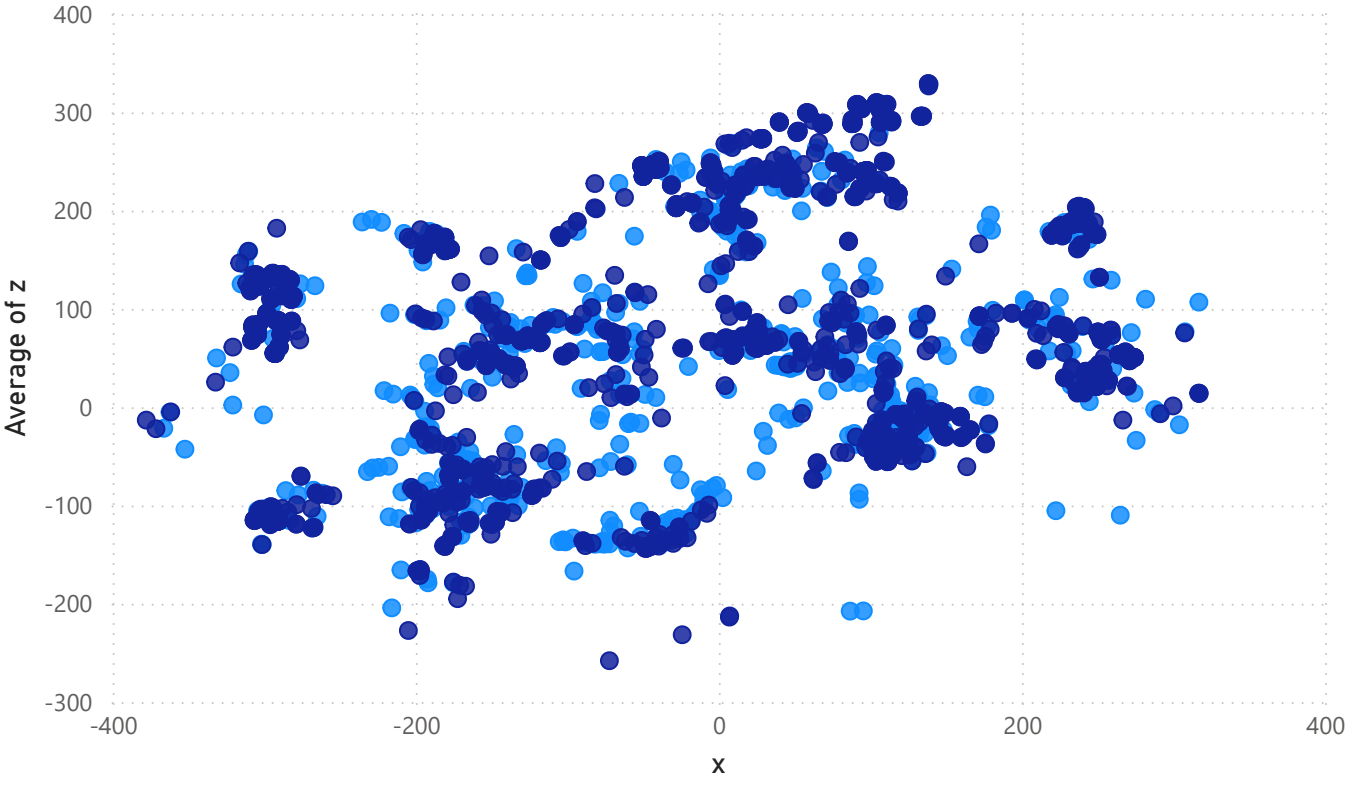

event_type ●combat ●loot

GrandRift

Lockdown

Insight 1: Average game time of Bots are higher than real players. Ideally game time of bots should be significantly lower compared to real gamers. Assuming the ability to kill are lower in bots these numbers mean the bots are placed in regions that are away from interactions with real players.

GrandRift is an extreme case with this.

Bots should be placed for confrontation with players early in the game to promote player confidence. Real players get easy kills early in the game and gain confidence.

Insight 3: The time distribution of loots and combats show high intensity at initial gaming minutes as expected, but there are consistent spells of inactivity after this in GrandRift and Lockdown.

This implies there are spells in the game where the game is only movement for players, making it less engaging. So distribution of loot should be more even.

Looting towards the end of the game is low as well, whether this is intentional or should be changed depends on how the firm wants to use the gamer's psychology.

Insight 2: Loots are distributed well in Lockdown but with the other two maps, the heat map reveals there is a huge concentration of loots towards the center of the map. This means it is implied to move towards the middle of the map. This makes the game a little more linear.

Whether the team wants to keep this to maintain ease of directional thinking for gamers or wants to change the center of action with algorithms depends on the firm's choice on gamer psychology. Use of bots becomes of significance once again.

Insight 4: GrandRift needs significant redistribution with resources. Despite having significant gamer and bots across the map, especially in corners, looting events are significantly concentrated in the middle of the map and sparse on a lot of other places more than the other two maps

This indicates a significant number of players needing to navigate without significant loot for most of the game or

The early spikes in time distribution of loot indicates high number of gamers starting from the middle of the map.

Peripheral space should be used better for events in GrandRift.
